MOORE'S LAW TIMELINE

Moore's Law – the observation that computing dramatically decreases in cost at a regular pace – is short-hand for rapid technological change. Over the past 50 years, it has ushered in the dawn of the personalization of technology and enabled new experiences through the integration of technology into almost all aspects of our lives.

MOORE'S LAW

Named for Gordon Moore (b. 1929). It is the idea that the number of transistors in a dense integrated circuit doubles approximately every two years. He developed this idea in a 1965 paper.

ZUSE Graphomat Z 64

The ZUSE Graphomat Z64 was a flatbed drawing machine of high precision. Its engineer, famous computer pioneer Konrad Zuse, had originally intended it to be used for the production of maps and for land registration purposes. Both Georg Nees and Frieder Nake did their first computer art pieces on the Graphomat. This historic fact may be seen as a case of an unintended use of a technical innovation. 'The Graphomat Z64 was fully based on transistor technology. It was controlled by a code that had to be input on punch tape or punch cards. The machine was first presented in 1961 at the Hannover Fair. Even though the first set of machines was ordered within a relatively short period of time, it did not become a great financial success.

Art and Science Proclaim Alliance in Avant-Garde Loft

By HENRY R. LIEBERMAN

In a sound-drenched Lower Manhattan loft building that was enlivened by revolving painted disks, film projections, floating pillows and miniskirted girls in paper smocks, representatives of industry and labor joined a number of artists and scientists yesterday to proclaim a "working alliance" between art and technology.

This modest and uncertain merger seeks to bridge the gap between the two worlds. It is intended to bring modern technological tools to the artist for creating new art forms and fresh insights and viewpoints to the engineer for creating a "people-oriented" technology.

The event was celebrated at a news conference "happening" in the six-story loft building at 381 Lafayette Street used for studio purposes by Robert Rauschenberg, the avant-garde artist.

Kheel's 'Biggest Mediation'

Mr. Rauschenberg, along with Dr. Billy Klüver, an electronics engineer who is specializing in laser research at the Bell Laboratories, and Theodore W. Kheel, the lawyer-labor mediator, are prime movers in the art-technology merger.

with a device operating like a television camera.

The information on the transparency was then stored on magnetic tape in the form of pulses standing for digits, with the brightness level of the picture elements represented by numbers ranging from 0 to 7. After processing all the numbers, the computer printed a drawing of micropatterns formed by clusters of symbols used in electronic design.

Visitors at the studios were intrigued by a sculptural representation of a woman taking a shower. As droplets of water dripped from the shower-head in a white stall, moving-picture images of the woman were registered by a projector behind the stall on a sand-blasted Plexiglass panel.

Rauschenberg's 'Oracle'

Another sculptural construction was a sound-emitting assembly consisting of a tire, truck door, window frame, bathtub and air vent. This is Mr. Rauschenberg's "Oracle."

Five radios are used, with the tuning dial of each being rotated by motor. Thus, each radio picks up snatches of the broadcasts of all the local

Drawing of nude above was generated by a computer under direction of L. D. Harmon and K. C. Knowlton, engineers. Black square encloses the detail shown.

contribution dollar that goes to the arts."

"Along with its obligation to be a profit-maker for its owners, the modern business corporation has an obligation to be a good citizen in the community," he said. "As a basic part of this obligation, the corporation must examine carefully its responsibility to

individuals in seeking to make "valuable contributions."

He noted that union members were also consumers, members of audiences and citizens concerned with the quality of society.

The event served to dramatize a drive to win organizational support for the art-technology merger and to mark the transfer of Experi-

with human problems caused by automation—notably the problem of individual "isolation."

Dr. Brodey, who heads M.I.T.'s science camp for underprivileged youngsters, noted that new technologies had opened large new areas of creativity. While the industrial revolution brought

Stan VanDerBeek, Movie-Drome,
1957-1969

Influenced by Buckminster Fuller's spheres, VanDerBeek had the idea for a spherical theater where people would lie down and experience movies all around them. Floating multi-images would replace straight one-dimensional film projection. From 1957 on, VanDerBeek produced film sequences for the Movie-Drome, which he started building in 1963. His intention went far beyond the building itself and moved into the surrounding biosphere, the cosmos, the brain and even extraterrestrial intelligence.

BY A. MICHAEL NOLL

Mondrian

Noll

In the late 1960 and early 1970's, he constructed interactive three-dimensional input devices and displays and a three-dimensional, tactile, force-feedback ("feelie") device that were the forerunners of today's virtual-reality systems. He also was one of the first researchers to demonstrate the potential of scanned displays for computer graphics.

E.A.T. PROJECTS OUTSIDE ART

December 8, 1969

235 Park Avenue South, New York, New York 10003

E.A.T. announces an exhibition, PROJECTS OUTSIDE ART – an exhibition of realizable projects in the environment – and requests submission of proposals.

Projects for the exhibition

- deal with such subjects as education, health, housing, concern for the natural environment, climate control, transportation, energy production and distribution, communication, food production and distribution, women's environment, cooking, entertainment, sports, etc.;
- use state-of-the-art technology;
- recognize, in particular, the scale adequate for the problem undertaken, social and ecological effects, organizational methods necessary for realizing the projects;

The concept of a “work of art” has always been subject to historical change..The crisis into which this concept of “the work” has now plunged is a sign of developments in art over the last hundred years. The most radical attack was launched by the avant-garde, who rejected the notions of originality, identity, authority, and purposelessness or l’art pour l’art, in an attempt to overcome the dichotomy between art and life and change experience of life through aesthetic means. Action art, performance, and happenings of the 1950s and 1960s mark the point where, at the very latest, the concept of a work of art as a discrete entity starts to break down. Ephemeral interactions with the audience attempted to allow contradictions, layers of meaning, and chance elements to enter into the work. Great expectations were initially placed in this pluralism, the “virtuality of possible orders,” as evidenced by Umberto Eco’s essay “Opera Aperta” [“Open Work”]. In “Opera Aperta,” the work of art is no longer a sort of encoded or enciphered message, viewed from the inside of production, to be deciphered by the observer using a repertoire of keys. Instead, it is an arrangement of possibilities; according to Eco, an ensemble of forms of organization, where many are entrusted with the initiative of the interpreter. According to this view, an image is the sum of possible narratives, histories, or interpretations that it allows. It is not predetermined, as was the classical artwork, for the substance of the interpreter is bound inseparably to arrangement of material. In Eco’s words: “The task of an open artwork is to give us a picture of discontinuity; it doesn’t tell of it, it is it.”

Osmose (1995) is an immersive interactive virtual-reality environment installation with 3D computer graphics and interactive 3D sound, a head-mounted display and real-time motion tracking based on breathing and balance. *Osmose* is a space for exploring the perceptual interplay between self and world, i.e., a place for facilitating awareness of one's own self as consciousness embodied in enveloping space.

Immersion in *Osmose* begins with the donning of the head-mounted display and motion-tracking vest. The first virtual space encountered is a three-dimensional Cartesian Grid which functions as an orientation space. With the immersant's first breaths, the grid gives way to a clearing in a forest. There are a dozen world-spaces in *Osmose*, most based on metaphorical aspects of nature. These include Clearing, Forest, Tree, Leaf, Cloud, Pond, Subterranean, Earth, and Abyss. There is also a substratum, Code, which contains much of the actual software used to create the work, and a superstratum, Text, a space consisting of quotes from the artist and excerpts of relevant texts on technology, the body and nature. Code and Text function as conceptual parentheses around the worlds within.

Through use of their own breath and balance, immersants are able to journey anywhere within these worlds as well as hover in the ambiguous transition areas in between. After fifteen minutes of immersion, the LifeWorld appears and slowly but irretrievably recedes, bringing the session to an end.

Char Davies, *Osmose*, 1995

<http://www.immersence.com/osmose/>

All elements combine to endow Osmose with a flowing and coherent quality that envelops the participant totally. As mentioned above, the totality of the effect is strengthened further because it dispenses with the use of portals and clearly defined boundaries between the image worlds in favor of osmotic transitions. For example, the immersant appears to move through a luminous digital tree. For Martin Buber, contemplating a tree was an occasion to reflect on conscious experience: “It may so happen, by grace and will combined, that I, in contemplating the tree, become enclosed within the relationship to it and then it is no longer an It. The power of wholeness has captured me.” All is unified, indistinguishably: “Image and movement, genus and example, law and number.” An aesthetic impression of immersion is a primary characteristic of virtual reality. However, being enveloped in a cocoon of images imposes profound limitations on the ability for critical detachment, a decisive hallmark of modern thought that has always played a central role in experience of and reflections on art.

-- Oliver Grau, 201-202

1.) How does Martin Buber's contemplation of the tree relate to ecology?

2.) Is VR a persuasive approximation of an ecological experience? Is one more connected or less connected to one's environment through VR?

3.) Does this immersion propagate critical distance? Where would it fall on the spectrum of Virtual Reality?

Whither embodiment in VR?

N. Katherine Hayles

Embodied Virtuality: Or How to Put Bodies Back Into the Picture [1996]

Cyberspace, we are often told, is a *disembodied* medium. Testimonies to this effect are everywhere, from William Gibson's fictional representation of the 'bodiless exultation of cyberspace' to John Parry Barlow's description of his virtual reality (VR) experience as 'my everything has been amputated.' In a sense, these testimonies are correct; the body remains in front of the screen rather than within it. In another sense, however, they are deeply misleading, for they obscure the crucial role that the body plays in constructing cyberspace. In fact, we are never disembodied. As anyone who designs VR simulations knows, the specifications of our embodiments matter in all kinds of ways, from determining the precise configurations of a VR interface to influencing the speed with which we can read a CRT screen. Far from being left behind when we enter cyberspace, our bodies are no less actively involved in the construction of virtuality than in the construction of real life.

OUTSIDE THE VORTEX

Meredith Tromble, Outside the Vortex, 2017

HAIR ON FIRE

As a young chemist, I was banished to research in a basement workshop because my superior thought women in the chemistry labs were dangerous — their hair might catch fire. For decades I collaborated with my fellow chemist Otto Hahn in Germany, then the Nazis came and I had to flee.

Hahn and I continued our research by letter. I worked out the theory for some strange experimental results that he could not understand, and so discovered atomic fission. In 1945, Hahn was awarded the Nobel Prize for his discovery of fission...but I was not mentioned.

Lise Meitner, Physicist
Co-discoverer of atomic fission

DOUBLE BIND

I have been told I can't do what I want to do because I am a woman and I have been told that I am only allowed to do what I have done because I am a woman.

Hope Jahren
Geochemist and Geobiologist

AFRAID

When I was an undergraduate in astronomy, my advisor was an internationally known scientist. I was grateful when he took time to talk to me about my career. But then he started talking about having sex outdoors with a woman he used to date. I stopped meeting with him after he gave me a ride home, parked, and started touching me, rubbing the back of my neck as I tried to get out of the car. I was afraid to report him because it might hurt my chances of going to graduate school.

Sarah Ballard, Astronomer

RIDICULOUS

I was the only woman at the Russian base in Antarctica. My team had just come in from grueling weeks in the field where I had done a lot of the heavy lifting. The man who made announcements to the entire base kept referring to me over the loudspeaker as "Princess."

Dawn Sumner, Geobiologist

Jill Scott is a video, sculpture and performance artist. Her artwork is focused on the human body and neuroscience

In "Taped," the figure stood on the tops of two twenty-foot ladders, one foot on each ladder and leaned against the outside wall of a warehouse. Two assistants took ten rolls of two-inch making tape and stuck the figure to the wall, defying gravity, until sundown.

FRONTIERS OF UTOPIA

Jill Scott, *Frontiers of Utopia*, 1995

In the installation *Frontiers of Utopia* the visitor is confronted with eight virtual female characters, based on the histories of real women who were born in different periods: 1900, 1930, 1960 and 1990. All eight characters dream of the way in which they will change their own lives as well as the world around them. In formulating their ideal future they also paint a picture of their own history and the way in which they view their world. The network of stories and references shows a rich variation in ideas, attitudes and historical perspectives with regard to the subjects that are being discussed. Although they all strive for their own ideals in their own time, they share common worries about happiness and health, reflecting also their worries about the future.

The viewer was able to construct a collage of sounds and images from 1900, 1930, 1960, 1990 by moving through both real and virtual space, their movement triggering sounds or by using icons on a touch sensitive screen. In this way they became time travellers, making interesting associations as well as learning about history in a new way.

In the installation the viewers can move interactively through the four time zone layers of «Frontiers of Utopia,» via touching icons and objects in the space as if they were time travellers. In another part of the installation they can attend a virtual dinner party where all the characters and their personal objects are available for comparison.
